WHY DO THIS:

Reduce perceived complexity while doing systems design

Give yourself a mental map of what you're doing

Visualization helps design

Faster iteration

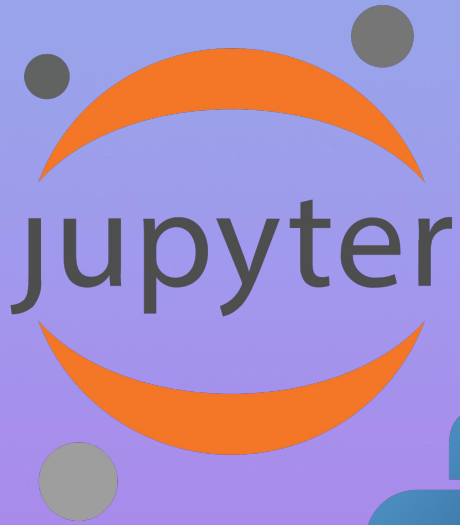
WHY PYTHON:

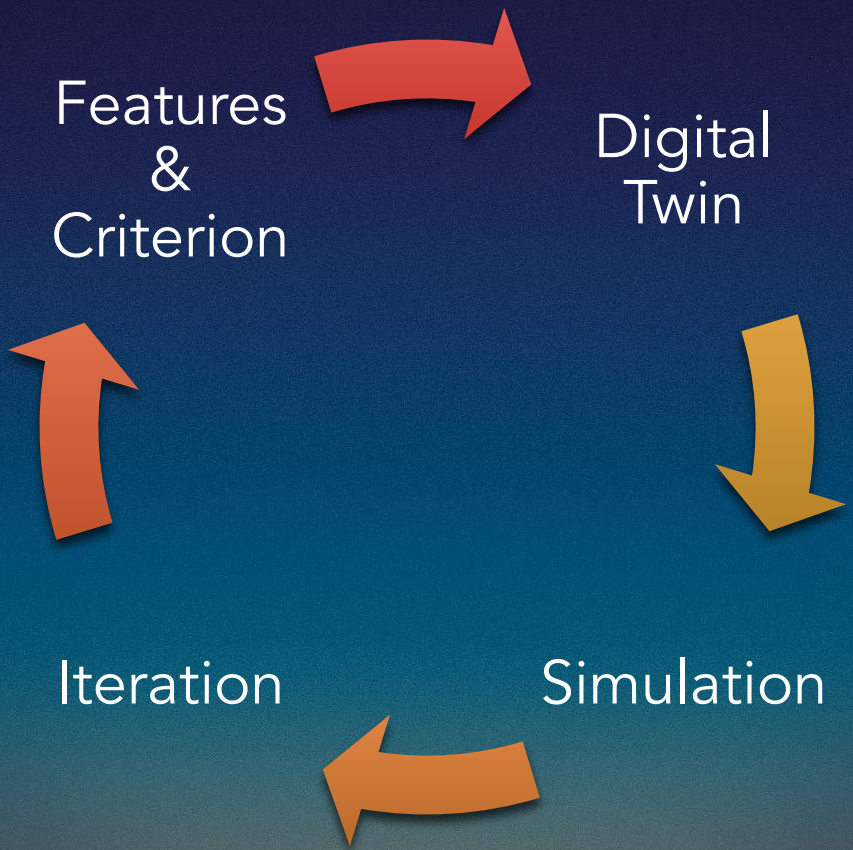
Endless [interactive] data visualization libraries

Easy to read for others

Jupyter notebook allows for trains of thought through text and code

Easy to transcribe algorithms





Features
&
Criterion
Digital
Twin

STEP 0: LET'S GET SOME DATA!

STEP 0: LET'S GET SOME DATA!

- Use Alchemy's API to download every basefee ever!

.. YES IT'S THERE

```python
import csv

# Define the file path
file_path = './data/dl_fees.csv'

# Write the dl_fees_int array to the CSV file
with open(file_path, 'w', newline='') as file:
    writer = csv.writer(file)
    writer.writerow(dl_fees_int)

```

```python
def get_fees(blocks: int, latest_block: str):
    assert blocks < 1025
    payload = {
        "id": 1,
        "jsonrpc": "2.0",
        "method": "eth_feeHistory",
        "params": [blocks, latest_block]
    }
    headers = {
        "accept": "application/json",
        "content-type": "application/json"
    }

    response = requests.post(url, json=payload, headers=headers)

    print(response.text)
    data = response.json()

    return (data['result']['oldestBlock'], data['result']["baseFeePerGas"])

def download_fees():
    fees = []
    cur_top = LATEST_BLOCK
    for i in range(OBSERVATION_PERIOD//1024):
        res = get_fees(1024, cur_top)
        cur_top = hex(int(cur_top,16) - i*1024)
        if(res[1][0]=="0x0"):
            break
        fees = fees + res[1]
        print("fees array length: ", len(fees))

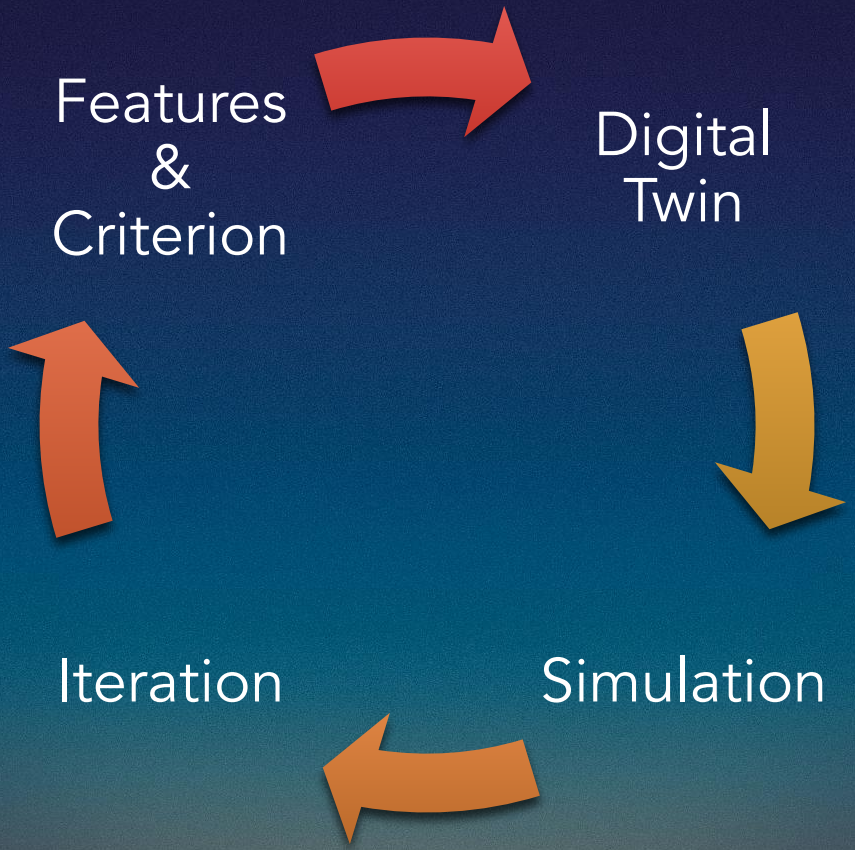
+ INTEGRATION AND A | B TESTING

Implementation

A | B Testing with Digital Twin

Take this away with you



Congratulations!
You have now officially made a complex system!

You are officially smart
